Preamble

The American College of Cardiology (ACC)/American Heart Association (AHA) performance measure sets serve as vehicles to accelerate translation of scientific evidence into clinical practice. Measure sets developed by the ACC/AHA are intended to provide practitioners and institutions that deliver cardiovascular services with tools to measure the quality of care provided and identify opportunities for improvement.
Writing committees are instructed to consider the methodology of performance measure development (1) and to ensure that the measures developed are aligned with ACC/AHA clinical guidelines. The writing committees also are charged with constructing measures that maximally capture important aspects of care quality, including timeliness, safety, effectiveness, efficiency, equity, and patient-centeredness, while minimizing, when possible, the reporting burden imposed on hospitals, practices, and/or practitioners.

Potential challenges from measure implementation may lead to unintended consequences. The manner in which challenges are addressed is dependent on several factors, including the measure design, data collection method, performance attribution, baseline performance rates, reporting methods, and incentives linked to these reports.

The ACC/AHA Task Force on Performance Measures (Task Force) distinguishes quality measures from performance measures. Quality measures are those metrics that may be useful for local quality improvement but are not yet appropriate for public reporting or pay for performance programs (uses of performance measures). New measures are initially evaluated for potential inclusion as performance measures. In some cases, a measure is insufficiently supported by the guidelines. In other instances, when the guidelines support a measure, the writing committee may feel it is necessary to have the measure tested to identify the consequences of measure implementation. Quality measures may then be promoted to the status of performance measures as supporting evidence becomes available.

Gregg C. Fonarow, MD, FACC, FAHA
Chair, ACC/AHA Task Force on Performance Measures

1. Introduction

In 2016, the ACC/AHA Task Force convened the writing committee to begin the process of revising the existing Cardiac Rehabilitation (CR) set that was released in 2007 (2) and for which a focused update was issued in 2010 (3). The writing committee also was charged with the task of developing new measures to benchmark and improve the quality of care for patients eligible for CR.
All the measures included in the measure set are briefly summarized in Table 1 which provides information on the measure number, measure title, and care setting. The detailed measure specifications (available in Appendix A) provide not only the information included in Table 1 but also provide more detailed information including the measure description, numerator, denominator (including denominator exclusions and exceptions), rationale for the measure, guideline that support the measure, measurement period, source of data, attribution.

The writing committee has developed a comprehensive CR measure set that includes 9 total measures, including 6 performance measures, and 3 quality measures as reflected in Table 1 and Appendix A. The writing committee believes that implementation of this measure set by health care systems, health care providers, health insurance carriers, chronic disease management organizations, CR programs and other groups that have responsibility for the delivery of care to persons with cardiovascular disease will help to enhance the structure, process, and outcomes of care provided to patients who are eligible for CR services.

1. Scope of the Problem

The recently published AHA Heart and Stroke Statistical report highlights the large number of patients who are in need of CR each year, including 625,000 patients discharged from U.S. hospitals following an acute coronary syndrome, 954,000 patients who underwent percutaneous coronary interventions, 500,000 patients discharged with a new diagnosis of heart failure, and 397,000 who underwent coronary artery bypass graft surgery (CABG) (4). Furthermore, data from the national Healthcare Cost and Utilization Project statistics show that over 608,000 patients were discharged with a primary diagnosis of acute myocardial infarction (AMI) in 2012 with a length of stay (mean) of 4.6 days, charges (mean) of more than $72,000 per patient stay and an in-hospital death rate of 5.16% (5). More than half a million patients with coronary atherosclerosis and other heart diseases were treated in hospitals in 2012 with a length of stay of 3.7 days and associated charges of almost $69,000 (5).

CR is a multidisciplinary, systematic approach to applying secondary prevention therapies of known benefit. Following a myocardial infarction (MI), CR decreases recurrent MI and mortality rates based on a meta-analysis of 34 randomized trials (6). Participation in CR programs can also improve a patient’s quality of life and ability to return to work more quickly (7,8). One study within a community demonstrated a 10-year absolute risk reduction in all-cause mortality of more than 12% in CABG patients who participate in a CR program (9). Studies have also found that CR participation is associated with a 20-30% reduction in hospital readmission during the year after a cardiac event (8,10,11).

Even with the underlying evidence demonstrating the benefits of CR, the majority of eligible patients are still not receiving this therapy.

Analyses show that:

- Just over 13% of Medicare patients who had an AMI and 30% after a CABG received CR (12).
• Certain sub-populations including ethnic minorities, women and those with caregiver-related responsibilities, multiple comorbidities, limited program access, and inadequate health insurance coverage are less likely to receive rehabilitation (12,13).

Data from the ACTION-Get With The Guidelines registry (2014) (4) on the current ST-elevation myocardial infarction/non-ST—elevation myocardial infarction measures related to CR continue to demonstrate an opportunity for improvement with 75.9% of patients with non-ST—elevation myocardial infarction receiving this referral and 84.5% for those with STEMI. Rates of CR referral are even lower (approximately 60%) for patients who undergo PCI (14). Similarly, data from the Get With The Guidelines-Heart Failure registry showed that in patients hospitalized for heart failure (HF), only 10.4% (12.2% with HFrEF and 8.8% with HFpEF) received CR referral at discharge (15).

Furthermore, in addition to a “referral gap,” an “enrollment gap” also exists in CR—with only about 50% of patients referred to CR actually enrolling and participating in CR (16-18). In addition, completion rates of CR are suboptimal (12,18). If CR participation rates were improved to at least 70%, it is estimated that approximately 25,000 deaths and 180,000 hospitalizations could be prevented each year (19). For all of the above-mentioned reasons, updating the existing CR measure set has been recognized as a high priority for the ACC and AHA. Particular attention has been given to the infrastructure and processes that are most likely to improve CR participation by eligible patients and ultimately improve patient outcomes. This document serves to reflect those measures that were developed by the writing committee after comprehensive internal discussion, peer review, and public comment.

1.2. Disclosure of Relationships With Industry and Other Entities

The ACC/AHA Task Force makes every effort to avoid actual, potential, or perceived conflicts of interest that could arise as a result of relationships with industry or other entities (RWI). Detailed information on the ACC/AHA policy on RWI can be found at http://www.acc.org/guidelines/about-guidelines-and-clinical-documents/relationships-with-industry-policy. All members of the writing committee, as well as those selected to serve as peer reviewers of this document, were required to disclose all current relationships and those existing within the 12 months before the initiation of this writing effort. ACC/AHA policy also requires that the writing committee chair and at least 50% of the writing committee have no relevant RWI.
Any writing committee member who develops new RWI during his or her tenure on the writing committee is required to notify staff in writing. These statements are reviewed periodically by the Task Force and by members of the writing committee. Author and peer reviewers RWI which are relevant to the document are included in the appendices: Please see Appendix B for relevant writing committee RWI and Appendix C for relevant peer reviewer RWI. Additionally, to ensure complete transparency, the writing committee members’ comprehensive disclosure information, including RWI not relevant to the present document, is available online at [insert link to Comprehensive RWI here once paper finalized] Disclosure information for the Task Force is also available online at http://www.acc.org/guidelines/about-guidelines-and-clinical-documents/guidelines-and-documents-task-forces.

The work of the writing committee was supported exclusively by the ACC and the AHA without commercial support. Members of the writing committee volunteered their time for this effort. Meetings of the writing committee were confidential and attended only by writing committee members and staff from the ACC, AHA, and the American Association of Cardiovascular and Pulmonary Rehabilitation (AACVPR) who served as a collaborator on this project.

2. Methodology

2.1. Literature Review

In developing the updated CR measure set, the writing committee reviewed evidence-based guidelines and statements that would potentially impact the construct of the measures. The practice guidelines and statements that most directly contributed to the development of these measures are shown in Table 2.

2.2. Definition and Selection of Measures

The writing committee reviewed both recent clinical practice guidelines and other clinical guidance documents in Table 2. The writing committee also examined available information on gaps in care to address which new measures might be appropriate as performance measures or quality measures for this measure set update.

The writing committee took into consideration a number of additional factors, including the following:

- Previous feedback from the National Quality Forum endorsement process and from the Centers for Medicare and Medicaid Services (CMS) has included suggestions to incorporate “enrollment” in the next version of the CR performance measures.

- CMS approved heart failure with reduced ejection fraction as a covered indication for CR, beginning in February 2014. In addition, the 2013 ACC/AHA Guideline for the Management of Heart Failure included a Class I recommendation for exercise training for patients with heart failure (23). These factors highlighted the need to incorporate such patients in the updated version of the CR measures.
• As ACC and AHA have recently worked with CMS to establish a consensus core set of
cardiovascular performance measures, the group decided to not include the CR referral
performance measure as a separate measure due to concerns about the difficulty for some
centers to collect the measure. However, the group did include the CR referral measure as
a component of the composite “defect free care” measure for MI (35). This suggests that
a goal of the updated version of the CR performance measures should be to improve the
ease of collection, while maintaining high quality standards for data that are collected.

• Input from CMS has also requested the e-specification of the performance measures, a
process that is difficult given that electronic health records generally do not include CR
referral as a discrete data field, making it necessary to use manual chart abstraction or
local electronic health record systems to collect data on CR referral. The CR referral
measure is currently included in ACC and AHA registries, an important step that may
serve as an example for ways in which vendors of electronic health records can include
the CR referral measure, as well as other measures included in the updated CR measures
set.

• Growing evidence suggests that alternative models of CR delivery (home-based,
electronic/mobile technology-based, etc.) are both feasible and potentially helpful for
increasing the reach of CR services, suggesting that the updated CR measures set should
be broad enough in scope to allow for the inclusion of alternative models of CR delivery
that are supported by published evidence.

• In January 2018, CMS will initiate a pilot program that includes the use of bundled
payments and/or CR financial incentives for a select number of geographical regions,
involving patients with AMI and/or those undergoing CABG surgery. Although it is
unclear if these models program will be implemented for the longer-term use, it still has
relevance to the updated CR measures, especially those aimed at promoting early
enrollment and treatment adherence, given that the CMS CR financial incentives are tied
to a patient’s adherence to CR sessions in the 90 days following the qualifying event.

CR measures were designed to cover two specific aspects of CR services: 1) referral of eligible
patients to a CR program and 2) delivery of CR services through multidisciplinary CR programs. The
measures also were designed to include all patients without a valid reason for exclusion from the measure. Measure exclusions are those reasons that remove a patient automatically from the denominator. For example, all measures excluded patients who were under 18 years of age. In contrast to exclusions, denominator exceptions are those conditions that remove a patient from the denominator only if the numerator criteria are not met. Denominator exceptions are used in select cases to allow for a fairer measurement of quality for those providers with higher risk populations. Exceptions are also used to defer to the clinical judgment of the provider. Several of the measures include exceptions. For example, in the case of the CR referral from an inpatient setting, a physician may recommend CR even if the patient says that he/she will not enroll in a CR program due to one or more reasons (e.g., lack of transportation, patient preference, etc.). In such a case, the physician would receive credit for the measure. If the patient has told the physician that he/she does not wish to enroll in a CR program, the physician can choose not to write the referral, and document in the medical record that the patient refused CR. In this scenario, the provider would not be penalized for the lack of a completed CR program referral as long as the patient reason is documented. The writing committee closely examined which exceptions should be included for each measure.

For the purposes of this document, a CR program is defined as a systematic, medically supervised program that helps patients recuperate from their cardiac event; adopt and adhere to healthy lifestyle habits; address co-morbid conditions (e.g., depression, diabetes, sleep apnea); monitor for safety issues; including new or recurrent signs or symptoms; and adhere to evidence-based medical therapies. A CR program may include a traditional center-based CR program that incorporates face-to-face interactions and supervised exercise training sessions or may include other delivery models that meet all criteria for a safe and effective CR program, as specified by AACVPR CR practice guidelines. In addition, an alternative CR program is defined as a hospital outpatient-based program that may include hybrid delivery options (e.g., remote monitoring, combined center- and home-based) as part of the program, and incorporates the core clinical and operational components of an industry-standard service that provides, tracks and reports on safe and effective exercise, and patient-centered disease management education aimed to progress patients toward improved outcomes in the clinical, functional and behavioral domains.

During the course of developing the measure set, the writing committee evaluated the potential measures against the ACC/AHA attributes of performance measures (Table 3) to reach consensus on which measures should be advanced for inclusion in the final measure set. After the peer review and
public comment period, the writing committee reviewed and discussed the comments received, and further refined the measure set. The writing committee acknowledges that the new measures created in this set will need to be tested and validated over time. By publishing this measure set, the writing committee hopes to encourage adoption of these performance measures which will help to facilitate the collection and analysis of data that are needed to assess the validity of these measures. In the future, the writing committee anticipates having data that will allow them to re-assess whether any of the measures included in this set should be modified, or potentially promoted from a quality measure to a performance measure.
Table 3. ACC/AHA Task Force on Performance Measures: Attributes for Performance Measures (36)

1. Evidence Based

- High-impact area that is useful in improving patient outcomes
  - a) For structural measures, the structure should be closely linked to a meaningful process of care that in turn is linked to a meaningful patient outcome.
  - b) For process measures, the scientific basis for the measure should be well established, and the process should be closely linked to a meaningful patient outcome.
  - c) For outcome measures, the outcome should be clinically meaningful. If appropriate, performance measures based on outcomes should adjust for relevant clinical characteristics through the use of appropriate methodology and high-quality data sources.

2. Measure Selection

- Measure definition
  - a) The patient group to whom the measure applies (denominator) and the patient group for whom conformance is achieved (numerator) are clearly defined and clinically meaningful.

- Measure exceptions and exclusions
  - b) Exceptions and exclusions are supported by evidence.

- Reliability
  - c) The measure is reproducible across organizations and delivery settings.

- Face validity
  - d) The measure appears to assess what it is intended to.

- Content validity
  - e) The measure captures most meaningful aspects of care.

- Construct validity
  - f) The measure correlates well with other measures of the same aspect of care.

3. Measure Feasibility

- Reasonable effort and cost*
  - a) The data required for the measure can be obtained with reasonable effort and cost.

- Reasonable time period
  - b) The data required for the measure can be obtained within the period allowed for data collection.

4. Accountability

- Actionable*
  - a) Those held accountable can affect the care process or outcome.

- Unintended consequences avoided
  - b) The likelihood of negative unintended consequences with the measure is low.

ACC indicates American College of Cardiology and AHA, American Heart Association.
3. ACC/AHA Cardiac Rehabilitation Measure Set Performance Measures

3.1 Discussion of Changes to 2008 and 2010 Cardiac Rehabilitation Measure Set

After reviewing the existing guidelines, the 2007 measure set (2) and the 2010 focused update (3), the writing committee discussed which measures required revision to reflect updated science in the field of CR, and identified which guideline recommendations could serve as the basis for new performance or quality measures. The writing committee also reviewed existing publically available measure sets.

The following subsections serve as a synopsis of the revisions that were made to previous measures, and a description of why the new measures were created for both the inpatient and outpatient setting.

3.1.1. Retired Measures

The writing committee decided to retire the “Set B” CR performance measures (CR program measures) included in the original 2007 CR measures set. This was done to avoid duplication of effort, since the “Set B” measures are currently being updated, tested, and implemented through a separate process by the AACVPR. The measures along with a brief rationale for retiring the measures are included in Table 4.

Table 4: Retired Cardiac Rehabilitation Measures from the 2007 Set

This measure will be considered for revision and/or maintenance by AACVPR as elements are used within the AACVPR CR Registry and Program Certification.

AACVPR indicates American Association of Cardiovascular and Pulmonary Rehabilitation and CR, cardiac rehabilitation.

### 3.1.2. Revised Measures

The writing committee reviewed and made changes to the inpatient and outpatient CR referral measures, as summarized in Table 5. Minimal changes were made, primarily those that improve ease of use of the measures and strengthen the construct of the measures. Table 5 provides information on the updated measures including the care setting, title, and a brief rationale for revisions made to the measures.
Table 5: Revised Cardiac Rehabilitation Measures

</tr>
</tbody>
</table>

CR indicates cardiac rehabilitation and PM, performance measures.
3.1.3. New Measures
The writing committee has created a comprehensive list of measures that can be utilized for patients who are eligible to participate in CR. This set includes five new performance measures, and three new quality measures. Table 6 includes a list of the measures with information on the care setting, and a brief rationale.

The measures are structured in a typical format in which the goal is to seek a higher performance score, ideally nearing 100%.

For more detailed information on the measure construct, please refer to the detailed measure specifications for each measure in Appendix A.

<tr>
<td>PM-5b</td>
<td>Outpatient</td>
<td>CR Enrollment - Registry/Electronic Health Records Based</td>
<td>While CR referral is a critically important first step in CR participation, CR enrollment is the goal of CR referral and is essential for patients to receive the benefits associated with CR participation. This option, to use registry/electronic health record data, is included to allow flexibility in the measure assessment for healthcare organizations that may wish to use registry/electronic health record data with or without the use of claims-based data. Non applicable</td>
<td></td>
</tr>
<tr>
<td>QM-1</td>
<td>Inpatient</td>
<td>CR Time to Enrollment</td>
<td>Research indicates that earlier enrollment into CR improves overall enrollment, thus it may also be associated with better patient outcomes. Specifically, for every day that passes after hospital discharge there is a ~1% decrease in participation (37). This measure may involve process improvement strategies at the patient, hospital, and program levels. Early enrollment in CR is a safe and important goal to help optimize enrollment, participation and eventual patient outcomes of CR. However, since time to enrollment is not part of the Class I, Level of Evidence A, clinical practice guidelines, this measure is being introduced as a QM.</td>
<td></td>
</tr>
<tr>
<td>QM-2</td>
<td>Outpatient</td>
<td>CR Adherence (≥25 sessions)</td>
<td>Research demonstrates that attending ≥25 sessions is associated with lower risks of death and MI at four years, compared with attending fewer sessions (38). While observational data show an association between “dose” of CR and patient outcomes, achievement of a “high dose” (i.e., ≥25 sessions) of CR is a very high level of performance, considering that only a minority of patients participate in any CR sessions at present. The writing group has proposed that this “high dose” measure be introduced as a QM, which CR programs and patients are encouraged to ideally achieve.</td>
<td></td>
</tr>
</tbody>
</table>

This draft document should be considered confidential and has been provided for comment purposes only. This document should not be cited or distributed to other individuals.
| QM-3 | Outpatient | CR Communication: Patient Enrollment Adherence and Clinical Outcomes | Research demonstrates that care coordination and communication between healthcare providers helps to improve quality of care, patient satisfaction, and patient outcomes. | While extremely important, CR communications to referring/primary healthcare providers is not part of Class I clinical practice recommendations. However, such care coordination is considered a standard of care and is included as a QM that CR programs are encouraged to ideally achieve. |

CR indicates cardiac rehabilitation; HFrEF, heart failure with reduced ejection fraction; HRQOL; health-related quality of life; MI, myocardial infarction; PM, performance measures; and QM, quality measure.
4. Areas for Further Research

Additional areas for further research that will potentially have an impact on CR performance and quality measures include the following:

- Impact of CR performance and quality measures on CR participation, adherence and related clinical outcomes.
- Impact of CR performance and quality measures on healthcare expenditures.
- Comparative effectiveness of center-based vs novel CR delivery models on CR participation, adherence, and related clinical outcomes.
- Impact of the inclusion of CR performance measures in “pay for performance” strategies, on CR participation, adherence, and outcomes.
- Novel performance and quality measures to stimulate higher CR participation and adherence rates.
- Performance and quality measures to promote longer-term adherence to secondary prevention therapies, after “completion” of early outpatient (Phase 2) CR.

### Performance Measures for Cardiac Rehabilitation

<table>
<thead>
<tr>
<th>Short Title: PM-1: Referral From Inpatient Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>PM-1: Cardiac Rehabilitation Patient Referral From an Inpatient Setting</strong></td>
</tr>
</tbody>
</table>

**Measure Description:** Percentage of patients, age $\geq 18$ y, hospitalized with a qualifying event/diagnosis for CR in the previous 12 m including: an MI, CSA or who during hospitalization have undergone CABG surgery, PCI, cardiac valve repair/replacement, or heart transplantation, are to be referred to an outpatient CR program.

**Numerator**

Patients with a qualifying event/diagnosis who have been referred to an outpatient CR program prior to hospital discharge.

A referral is defined as all of the below:

1. an official communication* between the health care provider and the patient to recommend and carry out a referral order to an outpatient CR program
2. an official referral order to an outpatient CR program, and
3. a communication between the health care provider or health care system and the receiving CR program that includes the patient’s referral information† for the program.

While all steps should be met, patients who refuse a CR referral should not have their data transmitted to the receiving CR program against their will. In that case, performance is considered to be met if the first two steps of the referral process and a patient refusal are documented in the patient’s medical record.

*All communications must maintain appropriate confidentiality as outlined by the 1996 Health Insurance Portability and Accountability Act [HIPAA].

†Necessary patient information may be found in the hospital discharge summary.

| Attribution | Measure reportable at facility level |
| Care Setting | Inpatient |
| Rationale | CR services have been shown to help reduce morbidity and mortality in persons who have experienced a recent coronary artery disease event, but these services are used in less than 30% of eligible patients (39).  
A key component to outpatient CR program utilization is the appropriate and timely referral of patients. Generally, the most important time for this referral to take place is while the patient is hospitalized for a qualifying event/diagnosis (MI, CSA, CABG, PCI, and cardiac valve repair/replacement).  
This performance measure has been developed to help healthcare systems implement effective steps in their systems of care that will optimize the appropriate referral of a patient to an outpatient CR program.  
This measure is designed to serve as a stand-alone measure or, preferably, to be included within other performance measurement sets that involve disease states or other conditions for which CR services have been found to be appropriate and beneficial (e.g., following MI, CABG surgery). This performance measure is provided in a format that is meant to allow easy and flexible inclusion into such performance measurement sets. |
Effective referral of appropriate inpatients to an outpatient CR program is the responsibility of the healthcare team within a healthcare system that is primarily responsible for providing cardiovascular care to the patient during the hospitalization.

Published evidence suggests that automatic referral systems accompanied by strong and supportive advice and guidance from a healthcare professional can significantly help improve CR referral and enrollment.

**Clinical Recommendation(s)**

**2014 AHA/ACC Guideline for the Management of Patients With Non–ST-elevation Acute Coronary Syndromes** (20)

1. All eligible patients with NSTE-ACS should be referred to a comprehensive cardiovascular rehabilitation program either before hospital discharge or during the first outpatient visit (40-43). *(Class I, Level of Evidence: B)*

**2013 ACCF/AHA Guideline for the Management of Patients With ST-Elevation Myocardial Infarction** (21)

1. Exercise-based cardiac rehabilitation/secondary prevention programs are recommended for patients with STEMI (42,44-46). *(Class I, Level of Evidence: B)*

**AHA/ACCF Secondary Prevention and Risk Reduction Therapy for Patients With Coronary Artery and Other Atherosclerotic Vascular Disease: 2011 Update** (27)

1. All eligible patients with ACS or whose status is immediately post coronary artery bypass surgery or post-PCI should be referred to a comprehensive outpatient cardiovascular rehabilitation program either prior to hospital discharge or during the first follow-up office visit (2,42,47,48). *(Class I, Level of Evidence: A)*

**AHA Effectiveness-Based Guidelines for the Prevention of Cardiovascular Disease in Women–2011 Update** (26)

1. A comprehensive CVD risk-reduction regimen such as cardiovascular or stroke rehabilitation or a physician-guided home- or community-based exercise training program should be recommended to women with a recent acute coronary syndrome or coronary revascularization, new-onset or chronic angina, recent cerebrovascular event, peripheral arterial disease *(Class I; Level of Evidence A)* or current/prior symptoms of heart failure and an LVEF 35%. *(Class I; Level of Evidence B)*

**2011 ACCF/AHA Guideline for Coronary Artery Bypass Graft Surgery** (28)

1. Cardiac rehabilitation is recommended for all eligible patients after CABG (2,42,47-50). *(Class I, Level of Evidence: A)*

CR services have been shown to help improve functional status, and may help reduce morbidity and mortality in persons with stable chronic heart failure with reduced HFrEF, but these services are used in a minority of eligible patients (39,51)

A key component to outpatient CR program utilization is the appropriate and timely referral of patients. Generally, the most important time for this referral to take place is while the patient is hospitalized for a HFrEF.

This performance measure has been developed to help healthcare systems implement effective steps in their systems of care that will optimize the appropriate referral of a patient to an outpatient CR program.

This measure is designed to serve as a stand-alone measure or, preferably, to be included within other performance measurement sets that involve patients with HFrEF. This performance measure is provided in a format that is meant to allow easy and flexible inclusion into such performance measurement sets.

Effective referral of appropriate inpatients to an outpatient CR program is the responsibility of the healthcare team within a healthcare system that is primarily responsible for providing cardiovascular care to the patient with HFrEF during the hospitalization.

Published evidence suggests that automatic referral systems accompanied by strong and supportive advice and guidance from a healthcare professional can significantly help improve CR referral and enrollment.

**Clinical Recommendation(s)**

**2013 ACCF/AHA Guideline for the Management of Heart Failure** (23)

1. Exercise training (or regular physical activity) is recommended as safe and effective for patients with HF who are able to participate to improve functional status (52-58). *(Class I, Level of Evidence: A)*

---

*This draft document should be considered confidential and has been provided for comment purposes only. This document should not be cited or distributed to other individuals*
1. All eligible patients with ACS or whose status is immediately post coronary artery bypass surgery or post-PCI should be referred to a comprehensive outpatient cardiovascular rehabilitation program either prior to hospital discharge or during the first follow-up office visit (2,42,47,48). (Class I, Level of Evidence: A)

2. All eligible outpatients with the diagnosis of ACS, coronary artery bypass surgery or PCI (Class I, Level of Evidence: A) (2,42,47,59), chronic angina (Class I, Level of Evidence: B) (2,48), and/or peripheral artery disease (Class I, Level of Evidence: A) (60,61) within the past year should be referred to a comprehensive outpatient cardiovascular rehabilitation program.

AHA Effectiveness-Based Guidelines for the Prevention of Cardiovascular Disease in Women – 2011 Update (26)

1. A comprehensive CVD risk-reduction regimen such as cardiovascular or stroke rehabilitation or a physician-guided home- or community-based exercise training program should be recommended to women with a recent acute coronary syndrome or coronary revascularization, new-onset or chronic angina, recent cerebrovascular event, peripheral arterial disease (Class I; Level of Evidence A) or current/prior symptoms of heart failure and an LVEF 35%. (Class I; Level of Evidence B)

Rationale

CR services have been shown to help reduce morbidity and mortality in persons who have experienced a recent coronary artery disease event, but these services are used in less than 30% of eligible patients (39). A key component to CR utilization is the appropriate and timely referral of patients to an outpatient CR program. While referral takes place generally while the patient is hospitalized for a qualifying event (MI, CSA, CABG, PCI, or cardiac valve repair/replacement,), there are many instances in which a patient can and should be referred from an outpatient clinical practice setting (e.g., when a patient does not receive such a referral while in the hospital, or when the patient fails to follow through with the referral for whatever reason).

This performance measure has been developed to help healthcare systems implement effective steps in their systems of care that will optimize the appropriate referral of a patient to an outpatient CR program.

This measure is designed to serve as a stand-alone measure or, preferably, to be included within other performance measurement sets that involve disease states or other conditions for which CR services have been found to be appropriate and beneficial (e.g., following MI, CABG surgery). This performance measure is provided in a format that is meant to allow easy and flexible inclusion into such performance measurement sets.

Referral of appropriate outpatients to a CR program is the responsibility of the healthcare provider within a healthcare system that is providing the primary cardiovascular care to the patient in the outpatient setting.

Published evidence suggests that automatic referral systems accompanied by strong and supportive advice and guidance from a healthcare professional can significantly help improve CR referral and enrollment.

Rationale

CR services have been shown to help improve functional status, and may help reduce morbidity and mortality in persons with stable chronic heart failure with reduced HFrEF, but these services are used in a minority of eligible patients (39,51).

A key component to outpatient CR program utilization is the appropriate and timely referral of patients. Generally, the most important time for this referral to take place is while the patient is hospitalized for a HFrEF.

This performance measure has been developed to help healthcare systems implement effective steps in their systems of care that will optimize the appropriate referral of a patient to an outpatient CR program.

This measure is designed to serve as a stand-alone measure or, preferably, to be included within other performance measurement sets that involve patients with HFrEF. This performance measure is provided in a format that is meant to allow easy and flexible inclusion into such performance measurement sets.

Effective referral of appropriate inpatients to an outpatient CR program is the responsibility of the healthcare team within a healthcare system that is primarily responsible for providing cardiovascular care to the patient with HFrEF during the hospitalization.

Published evidence suggests that automatic referral systems accompanied by strong and supportive advice and guidance from a healthcare professional can significantly help improve CR referral and enrollment.

Clinical Recommendation(s)

2013 ACCF/AHA Guideline for the Management of Heart Failure (23)
Exercise training (or regular physical activity) is recommended as safe and effective for patients with HF who are able to participate to improve functional status (52-58). (Class I, Level of Evidence: A)

AHA/ACCF Secondary Prevention and Risk Reduction Therapy for Patients with Coronary Artery and Other Atherosclerotic Vascular Disease: 2011 Update (27)

1. All eligible patients with ACS or whose status is immediately post coronary artery bypass surgery or post-PCI should be referred to a comprehensive outpatient cardiovascular rehabilitation program either prior to hospital discharge or during the first follow-up office visit (2,42,47,48). (Class I, Level of Evidence: A)

2. All eligible outpatients with the diagnosis of ACS, coronary artery bypass surgery or PCI (Class I, Level of Evidence: A) (2,42,47,59), chronic angina (Class I, Level of Evidence: B) (2,48), and/or peripheral artery disease (Class I, Level of Evidence: A) (60,61) within the past year should be referred to a comprehensive outpatient cardiovascular rehabilitation program.

AHA Effectiveness-Based Guidelines for the Prevention of Cardiovascular Disease in Women – 2011 Update (26)

1. A comprehensive CVD risk-reduction regimen such as cardiovascular or stroke rehabilitation or a physician-guided home- or community-based exercise training program should be recommended to women with a recent acute coronary syndrome or coronary revascularization, new-onset or chronic angina, recent cerebrovascular event, peripheral arterial disease (Class I: Level of Evidence A) or current/prior symptoms of heart failure and an LVEF 35%. (Class I: Level of Evidence B)

ACC indicates American College of Cardiology; ACCF, American College of Cardiology Foundation; ACS, acute coronary syndrome; AHA, American Heart Association; CABG, coronary artery bypass graft; CSA chronic stable angina; CR, cardiac rehabilitation; CVD, cardiovascular disease; HF, heart failure; HFrEF, heart failure with reduced ejection fraction; LVEF, left ventricular ejection fraction; MI, myocardial infarction; and PCI, percutaneous coronary intervention.

### Rationale

Participation in CR significantly improves meaningful patient outcomes, including mortality, readmissions to acute care, functional capacity, psychosocial well-being, and health-related quality of life. There are geographic and demographic disparities related to CR, which can be influenced by changes in systems and processes that address barriers to participation (19).

While referral to CR is the first, critical step to involve patients in a CR program, actual enrollment in the CR program is essential to CR participation. Measuring CR enrollment will encourage both referring practitioners/facilities and CR programs to develop performance improvement activities that increase participation.
Clinical Recommendation(s)

2014 AHA/ACC Guideline for the Management of Patients With Non–ST-Elevation Acute Coronary Syndromes (20)

1. All eligible patients with NSTE-ACS should be referred to a comprehensive cardiovascular rehabilitation program either before hospital discharge or during the first outpatient visit (40-43). (Class I, Level of Evidence: B)

- Documentation of a medical reason that precludes enrollment in CR (e.g., patient deemed by a medical provider to have a medically unstable, life-threatening condition or has other cognitive or physical impairments that preclude CR participation)  
- Documentation of a healthcare system reason that precludes enrollment in CR (e.g., patient is discharged to a nursing care or long-term care facility, or patients lack medical coverage for CR) |
| **Measurement Period** | Encounter |
| **Sources of Data** | Medical record or other database (e.g., clinical or registry) |
| **Attribution** | Measure reportable at provider level |
| **Care Setting** | Inpatient or Outpatient |

**Rationale**
Participation in CR significantly improves meaningful patient outcomes, including mortality, readmissions to acute care, functional capacity, psychosocial well-being, and health related quality of life. There are geographic and demographic disparities related to CR, which can be influenced by changes in systems and processes that address barriers to participation (19).

While referral to CR is the first, critical step to involve patients in a CR program, actual enrollment in the CR program is essential to CR participation. Measuring CR enrollment will encourage both referring practitioners/facilities and cardiac rehabilitation programs to develop performance improvement activities that increase participation.

**Clinical Recommendation(s)**

**2014 AHA/ACC Guideline for the Management of Patients With Non–ST-elevation Acute Coronary Syndromes** (20)

1. All eligible patients with NSTE-ACS should be referred to a comprehensive cardiovascular rehabilitation program either before hospital discharge or during the first outpatient visit (40-43). (Class I, Level of Evidence: B)

**2013 ACCF/AHA Guideline for the Management of Patients With ST-Elevation Myocardial Infarction** (21)

1. Exercise-based cardiac rehabilitation/secondary prevention programs are recommended for patients with STEMI (42,44-46). (Class I, Level of Evidence: B)

**AHA/ACCF Secondary Prevention and Risk Reduction Therapy for Patients with Coronary Artery and Other Atherosclerotic Vascular Disease: 2011 Update** (27)

1. All eligible patients with ACS or whose status is immediately post coronary artery bypass surgery or post-PCI should be referred to a comprehensive outpatient cardiovascular rehabilitation program either prior to hospital discharge or during the first follow-up office visit (2,42,47,48). (Class I, Level of Evidence: A)

2. All eligible outpatients with the diagnosis of ACS, coronary artery bypass surgery or PCI (Class I, Level of Evidence: A) (2,42,47,59), chronic angina (Class I, Level of Evidence: B) (2,48), and/or peripheral artery disease (Class I, Level of Evidence: A) (60,61) within the past year should be referred to a comprehensive outpatient cardiovascular rehabilitation program.

**AHA Effectiveness-Based Guidelines for the Prevention of Cardiovascular Disease in Women–2011 Update** (26)

1. A comprehensive CVD risk-reduction regimen such as cardiovascular or stroke rehabilitation or a physician-guided home- or community-based exercise training program should be recommended to women with a recent acute coronary syndrome or coronary revascularization, new-onset or chronic angina, recent cerebrovascular event, peripheral arterial disease (Class I, Level of Evidence A) or current/prior symptoms of heart failure and an LVEF 35%. (Class I; Level of Evidence B)

**2011 ACCF/AHA Guideline for Coronary Artery Bypass Graft Surgery** (28)

1. Cardiac rehabilitation is recommended for all eligible patients after CABG (2,42,47-50). (Class I, Level of Evidence: A)
ACC indicates American College of Cardiology; ACCF, American College of Cardiology Foundation; ACS, acute coronary syndrome; AHA, American Heart Association; CABG, coronary artery bypass graft; CSA, chronic stable angina; CR, cardiac rehabilitation; CVD, cardiovascular disease; LVEF, left ventricular ejection fraction; MI, myocardial infarction; NSTE-ACS, non–ST-elevation myocardial infarction- acute coronary syndromes; and PCI, percutaneous coronary intervention.

## Quality Measures for Cardiac Rehabilitation

### Short Title: QM-1: Time to Enrollment

<table>
<thead>
<tr>
<th>QM-1: Cardiac Rehabilitation Time to Enrollment (21 days)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Percentage of patients, age ≥18 y, with a qualifying event/diagnosis including MI, PCI, CABG, heart valve surgery/repair, and/or heart transplantation, who enroll in CR within 21 d of hospital discharge.</td>
</tr>
</tbody>
</table>

**Numerator**
Patients discharged from the hospital after qualifying event/diagnosis, who are referred to CR, and who begin CR participation ≤21d after hospital discharge

**Denominator**
All patients discharged from the hospital after qualifying event/diagnosis including: MI, PCI, CABG, heart valve surgery/repair and/or heart transplantation, who are referred to CR, and who begin CR participation (at least one billed CR session)

**Denominator Exclusions**
- Patients age <18 y
- Patients who leave against medical advice

**Denominator Exceptions**
- Documentation of a patient-oriented reason that precludes CR participation after the patient has enrolled (e.g., patient moves to a new location that requires more than 60 minutes travel time to arrive at the enrolling CR program)
- Documentation of a medical reason that precludes CR participation after the patient has enrolled (e.g., patient deemed by a medical provider to have a medically unstable, life-threatening condition or has other cognitive or physical impairments that preclude CR participation)
- Documentation of a healthcare system reason that precludes CR participation after the patient has enrolled (e.g., patient is admitted to nursing care or long-term care facility, or patients loses medical coverage for CR)

**Measurement Period**
Encounter

**Sources of Data**
Medical record or other database (e.g., administrative, clinical, registry)

**Attribution**
Measure reportable at the facility or provider level
Care Setting

Shared responsibility between healthcare centers and CR program

Rationale

A variety of factors influence CR, including patient-, medical-, program- and system-related issues. Current literature (single-site randomized, systematic review and observational) suggests that targeting earlier enrollment in rehabilitation improves over-all enrollment, such that for every day that passes after hospital discharge there is a ~1% decrease in program participation rate. One randomized trial targeted <10 d for time from qualifying event to enrollment and showed an 18% improvement in time to first visit in CR (62). A systematic review suggested 17d as the optimal duration of time (63).

As with other CR performance measures, this performance measure addressing time from discharge to start in rehabilitation is important, in that it can influence potential processes or barriers at the patient (conflict with return to work), hospital, provider, and program (workflow and throughput) levels.

Clinical Recommendation(s)

2014 AHA/ACC Guideline for the Management of Patients With Non–ST-elevation Acute Coronary Syndromes (20)

1. All eligible patients with NSTE-ACS should be referred to a comprehensive cardiovascular rehabilitation program either before hospital discharge or during the first outpatient visit (40-43). (Class I, Level of Evidence: B)

2013 ACCF/AHA Guideline for the Management of Patients With ST-Elevation Myocardial Infarction (21)

1. Exercise-based cardiac rehabilitation/secondary prevention programs are recommended for patients with STEMI (42,44-46). (Class I, Level of Evidence: B)

AHA/ACCF Secondary Prevention and Risk Reduction Therapy for Patients with Coronary Artery and Other Atherosclerotic Vascular Disease: 2011 Update (27)

1. All eligible patients with ACS or whose status is immediately post coronary artery bypass surgery or post-PCI should be referred to a comprehensive outpatient cardiovascular rehabilitation program either prior to hospital discharge or during the first follow-up office visit (2,42,47,48). (Class I, Level of Evidence: A)

2. All eligible outpatients with the diagnosis of ACS, coronary artery bypass surgery or PCI (Class I, Level of Evidence: A) (2,42,47,59), chronic angina (Class I, Level of Evidence: B)(2,48), and/or peripheral artery disease (Class I, Level of Evidence: A) (60,61) within the past year should be referred to a comprehensive outpatient cardiovascular rehabilitation program.

AHA Effectiveness-Based Guidelines for the Prevention of Cardiovascular Disease in Women–2011 Update (26)

1. A comprehensive CVD risk-reduction regimen such as cardiovascular or stroke rehabilitation or a physician-guided home- or community-based exercise training program should be recommended to women with a recent acute coronary syndrome or coronary revascularization, new-onset or chronic angina, recent cerebrovascular event, peripheral arterial disease (Class I; Level of Evidence A) or current/prior symptoms of

ACCF/AHA Guideline for Coronary Artery Bypass Graft Surgery (28)

1. Cardiac rehabilitation is recommended for all eligible patients after CABG (2,42,47-50). (Class I, Level of Evidence: A)

ACC indicates American College of Cardiology; ACCF, American College of Cardiology Foundation; ACS, acute coronary syndrome; AHA, American Heart Association; CABG, coronary artery bypass graft; CR, cardiac rehabilitation; CVD, cardiovascular disease; LVEF, left ventricular ejection fraction; MI, myocardial infarction; NSTE-ACS, non–ST-elevation myocardial infarction- acute coronary syndromes; and PCI, percutaneous coronary intervention.
### Short Title: QM-2: Cardiac Rehabilitation Adherence (≥25 sessions)

### QM-2: Cardiac Rehabilitation Adherence (≥25 sessions)

**Measure Description:** Percentage of patients, age ≥18 y, with a qualifying event/diagnosis for CR including: MI, PCI, CABG, heart valve repair/replacement, heart transplantation, or HFrEF, who have enrolled in CR and have participated in ≥25 sessions.

<table>
<thead>
<tr>
<th>Numerator</th>
<th>Patients with a qualifying event/diagnosis who have enrolled in CR and have participated in ≥25 CR sessions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Denominator</td>
<td>All patients with a qualifying event/diagnosis in the: MI, PCI, CABG, CSA, valve repair/replacement, heart transplantation, or HFrEF and who were enrolled in CR during the 3 m prior to the start of the measurement period.</td>
</tr>
<tr>
<td>Note: Sites can only report this on a semi-annual basis.</td>
<td></td>
</tr>
</tbody>
</table>

**Denominator Exclusions**
- Patients age <18 y
- Patients who leave against medical advice

**Denominator Exceptions**
- Documentation of a patient-oriented reason that precludes CR participation after the patient has enrolled (e.g., patient moves to a new location that requires more than 60 minutes travel time to arrive at the enrolling CR program)
- Documentation of a medical reason that precludes CR participation after the patient has enrolled (e.g., patient deemed by a medical provider to have a medically unstable, life-threatening condition or has other cognitive or physical impairments that preclude CR participation)
- Documentation of a healthcare system reason that preclude CR participation after the patient has enrolled (e.g., patient is admitted to a nursing care or long-term care facility, or patients loses medical coverage for CR)

**Measurement Period**
Quarterly

**Sources of Data**
Claims databases, Medical record or other database (e.g. administrative, clinical, registry)

**Attribution**
Measure reportable at the facility or provider level

**Care Setting**
Outpatient, CR program

**Rationale**
Participation in CR significantly improves meaningful patient outcomes, including mortality, readmissions to acute care, functional capacity, psychosocial well-being, and health-related quality of life. A dose-response relationship
has been demonstrated between the number of CR sessions and long-term outcomes and has been estimated at 1% mortality reduction per session of CR attended (38,46,64,65). Attending ≥36 sessions is associated with lower risks of death and MI at 4 years compared to attending fewer sessions. Thus, the optimal dose of CR appears to be ≥36 CR sessions.

Clinical Recommendation(s)

**2014 AHA/ACC Guideline for the Management of Patients With Non–ST-Elevation Acute Coronary Syndromes (20)**

1. All eligible patients with NSTE-ACS should be referred to a comprehensive cardiovascular rehabilitation program either before hospital discharge or during the first outpatient visit (40-43). *(Class I, Level of Evidence: B)*

**2013 ACCF/AHA Guideline for the Management of Patients With ST-Elevation Myocardial Infarction (21)**

1. Exercise-based cardiac rehabilitation/secondary prevention programs are recommended for patients with STEMI (42,44-46). *(Class I, Level of Evidence: B)*

**AHA/ACCF Secondary Prevention and Risk Reduction Therapy for Patients with Coronary Artery and Other Atherosclerotic Vascular Disease: 2011 Update (27)**

1. All eligible patients with ACS or whose status is immediately post coronary artery bypass surgery or post-PCI should be referred to a comprehensive outpatient cardiovascular rehabilitation program either prior to hospital discharge or during the first follow-up office visit(2,42,47,48). *(Class I, Level of Evidence: A)*

2. All eligible outpatients with the diagnosis of ACS, coronary artery bypass surgery or PCI *(Class I, Level of Evidence: A)* (2,42,47,59), chronic angina *(Class I, Level of Evidence: B)* (2,48), and/or peripheral artery disease *(Class I, Level of Evidence: A)* (60,61) within the past year should be referred to a comprehensive outpatient cardiovascular rehabilitation program.

**2012 ACCF/AHA Guideline for the Management of Heart Failure**

1. Exercise training (or regular physical activity) is recommended as safe and effective for patients with HF who are able to participate to improve functional status (52-58). *(Class I, Level of Evidence: A)*

**AHA Effectiveness-Based Guidelines for the Prevention of Cardiovascular Disease in Women–2011 Update (26)**

1. A comprehensive CVD risk-reduction regimen such as cardiovascular or stroke rehabilitation or a physician-guided home- or community-based exercise training program should be recommended to women with a recent acute coronary syndrome or coronary revascularization, new-onset or chronic angina, recent cerebrovascular event, peripheral arterial disease *(Class I, Level of Evidence A)* or current/prior symptoms of heart failure and an LVEF 35%. *(Class I; Level of Evidence B)*

**2011 ACCF/AHA Guideline for Coronary Artery Bypass Graft Surgery (28)**

1. Cardiac rehabilitation is recommended for all eligible patients after CABG (2,42,47-50). *(Class I, Level of Evidence: A)*
ACC, indicates American College of Cardiology; ACCF, American College of Cardiology Foundation; ACS, acute coronary syndrome; AHA, American Heart Association; CABG, coronary artery bypass graft; CR, cardiac rehabilitation; CVD, cardiovascular disease; HF, heart failure; HFrEF, heart failure with reduced ejection fraction; LVEF, left ventricular ejection fraction; MI, myocardial infarction; NSTE-ACS, non–ST-elevation myocardial infarction- acute coronary syndromes; and PCI, percutaneous coronary intervention.
### Short Title: QM-3: Cardiac Rehabilitation Outcomes Communication

<table>
<thead>
<tr>
<th>QM-3: Cardiac Rehabilitation Communication: Patient Enrollment, Adherence, and Clinical Outcomes</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Measure Description:</strong> Percentage of patients, age ≥18 y, for whom the receiving CR program has communicated to the referring provider and/or primary care provider regarding the patient’s enrollment, attendance and key clinical outcomes (e.g., changes in functional capacity, quality of life) in the CR program.</td>
</tr>
<tr>
<td><strong>Numerator</strong></td>
</tr>
<tr>

</tbody>
</table>
### Care Setting
Outpatient, CR Program

### Rationale
A key function of CR is to help coordinate the care of patients, often with very complex cardiovascular conditions, who are referred to CR. Communication between the CR program and the referring provider helps provide greater coordination of care by providing information to the referring provider that will be of help in the management of the patient’s cardiovascular disease.

### Clinical Recommendation(s)

**2014 AHA/ACC Guideline for the Management of Patients With Non–ST-elevation Acute Coronary Syndromes (20)**

1. All eligible patients with NSTE-ACS should be referred to a comprehensive cardiovascular rehabilitation program either before hospital discharge or during the first outpatient visit (40-43). *(Class I, Level of Evidence: B)*

**2013 ACCF/AHA Guideline for the Management of Patients With ST-Elevation Myocardial Infarction (21)**

1. Exercise-based cardiac rehabilitation/secondary prevention programs are recommended for patients with STEMI (42,44-46). *(Class I, Level of Evidence: B)*

**2012 ACCF/AHA Guideline for the Management of Heart Failure**

1. Exercise training (or regular physical activity) is recommended as safe and effective for patients with HF who are able to participate to improve functional status (52-58). *(Class I, Level of Evidence: A)*

**AHA/ACCF Secondary Prevention and Risk Reduction Therapy for Patients with Coronary Artery and Other Atherosclerotic Vascular Disease: 2011 Update (27)**

1. All eligible patients with ACS or whose status is immediately post coronary artery bypass surgery or post-PCI should be referred to a comprehensive outpatient cardiovascular rehabilitation program either prior to hospital discharge or during the first follow-up office visit (2,42,47,48). *(Class I, Level of Evidence: A)*

2. All eligible outpatients with the diagnosis of ACS, coronary artery bypass surgery or PCI (Class I, Level of Evidence: A)(2,42,47,59), chronic angina *(Class I, Level of Evidence: B)*(2,48), and/or peripheral artery disease *(Class I, Level of Evidence: A)* (60,61) within the past year should be referred to a comprehensive outpatient cardiovascular rehabilitation program.

**AHA Effectiveness-Based Guidelines for the Prevention of Cardiovascular Disease in Women–2011 Update (26)**

1. A comprehensive CVD risk-reduction regimen such as cardiovascular or stroke rehabilitation or a physician-guided home- or community-based exercise training program should be recommended to women with a recent acute coronary syndrome or coronary revascularization, new-onset or chronic angina, recent cerebrovascular event, peripheral arterial disease *(Class I, Level of Evidence A)* or current/prior symptoms of heart failure and an LVEF 35%. *(Class I, Level of Evidence B)*
1. Cardiac rehabilitation is recommended for all eligible patients after CABG (2,42,47-50). *(Class I, Level of Evidence: A)*

This table represents the relationships of committee members with industry and other entities that were reported by authors to be relevant to this document. These relationships were reviewed and updated in conjunction with all meetings and/or conference calls of the writing committee during the document development process. The table does not necessarily reflect relationships with industry at the time of publication. A person is deemed to have a significant interest in a business if the interest represents ownership of 5% or more of the voting stock or share of the business entity, or ownership of $5,000 or more of the fair market value of the business entity; or if funds received by the person from the business entity exceed 5% of the person’s gross income for the previous year. A relationship is considered to be modest if it is less than significant under the preceding definition. Relationships in this table are modest unless otherwise noted.
