

Surviving MI

AN ACC QUALITY INITIATIVE

Monday, April 24, 2017

Quality Improvement
for Institutions

How this webinar is organized

Time	Topic
2:00pm	Welcome and Introductions
2:10pm -2:50pm	Improving AMI Care
	Kingman Regional Medical Center <i>Kingman, AZ</i>
	Dartmouth-Hitchcock <i>Lebanon, NH</i>
	Billings Clinic <i>Billings, MT</i>
2:50pm	Q&A
2:57pm	Wrap-up and Next Steps

Quality Improvement
for Institutions

Kingman Regional Medical Center

- 235 Beds
- Independent, not for profit health system
- Member of Mayo Clinic Care Network
- Teaching Hospital – Family Practice & ER
- 8700 admissions
- 53,000 ER visits
- 417,000 outpatient visits
- 1900 employees
- 270 physicians on staff

Service Area

-  Mohave County, Arizona
-  KRMHC Service Area

Primary Service Area – Approximately 75,000 people

- Disproportionate number of elderly and poor when compared to national demographics
- Some communities are over 60 miles from the hospital

Payer Mix:

- 57% Medicare
- 22% Medicaid
- 18% Commercial
- 3% Self Pay

Mission and Vision

Kingman Regional Medical Center Mission

Serving our community with compassion and commitment.

Our Vision

To provide the region's best clinical care and patient service through an environment that fosters respect for others and pride in performance.

Problem and Objective

- **The problem is AMI mortality is too high**
- **Our objective is:**
 - Reduce in hospital AMI mortality rate, not risk adjusted by 50% of baseline by June 2016.
 - Reduce risk standardized AMI mortality rate by 15% of the National Average by June 2016.

Our Journey

Guiding Coalition Formation August 2014

- Initial group > 20 members
- Initial Objective: Not S.M.A.R.T.

Root Causes Identified:

- Timeliness of EKGs
- Pathways, Protocols and Guidelines
- Discharge Process

Our Journey

Strategies Selected:

1. Partnership with EMS
2. Organizational culture that supports creative problem solving
3. Physician and nurse champion for AMI care
4. Nurses consistently assigned to the Cardiac Catheterization Laboratory

Our Journey

- The team initially looked perfect, but had internal struggles. We were too big and we had silos. We were making individual contributions, but not functioning as a team.
- We were “Transactional” leaders, but were not “Transformational” leaders.

Our Journey

- CEO Visits Guiding Coalition Meeting March 2015
“Our vision is to provide the regions best clinical care and patient service through an environment that fosters respect for others and pride in performance.”
- Our results did not match our vision.

Our Journey

With a renewed sense of urgency, we:

- Reconnected to our vision.
- Our Guiding Coalition was re-defined and downsized.
- Re-defined our objective, making it S.M.A.R.T
- Empowered front line staff to support creative problem solving and process improvement.
- Began making more “transformations” than “transactions”.
- Stopped frequent meetings!

Our Journey: Evidence of Creative Problem Solving

- | | |
|--|---|
| ✓ Implemented “Nurse First” | ✓ Improved Pt. Education at Discharge |
| ✓ Trained ED CNA staff to preform EKGs | ✓ Pharmacist rounding on all AMI patients from Cath Lab |
| ✓ Created space in our ED to obtain EKGs | ✓ Improved Compliance with PCI in 90 minutes |
| ✓ Synchronized Clocks | |
| ✓ Created “Stemi Boxes” | |
| ✓ Created AMI order Set | |

Our Journey

Evidence that we were moving in the right direction

Our Journey

Inspired by our progress, our Guiding Coalition began:

- Regular “drill down” on all AMI mortalities as well as PCI in 90 minute fallouts.
- Checked patient status:
 - Admission vs. Observation
 - Post Procedure in a bed
- Checked/Validated Coding
- Problems were noted, but with the collective efforts of the team issues were identified and addressed.

**Percutaneous Coronary Intervention (PCI)
Door to Balloon Time**

**Percent of Patients with
Door to Balloon time of ≤ 90 minutes**

FY 2016 Target: 95%
FY2015 84.6%
FY2016 93.4%
FY2017 (through January) 100%

Our Results

AMI Mortality Rate Excluding Open Heart Program Patients

Our Change Process

1. Pull together a team to drive the change
2. Define a S.M.A.R.T. goal
3. Create the Vision
4. Instill a sense of urgency
5. Empower staff to perform / utilize creative problem solving
6. Engage direct care staff – “Our Staff Save Lives”
7. Link efforts to outcomes
8. Reward short term wins
9. Communicate. Don’t fall back, and never let up!

Reducing Mortality in Acute Myocardial Infarction Dartmouth-Hitchcock LSL Journey

Dartmouth-Hitchcock is a non-profit academic health system in Lebanon, NH serving communities in northern New England.
396 licensed beds and has more than 27,000 discharges and close to 31,000 Emergency Department visits annually.
Member of the Mayo Clinic Care Network

Nathaniel W. Niles, MD
Sheila M. Conley, BSN, RN

Quality Improvement
for Institutions

Surviving MI AN ACC QUALITY INITIATIVE

LEADERSHIP SAVES LIVES

Initial Action Steps

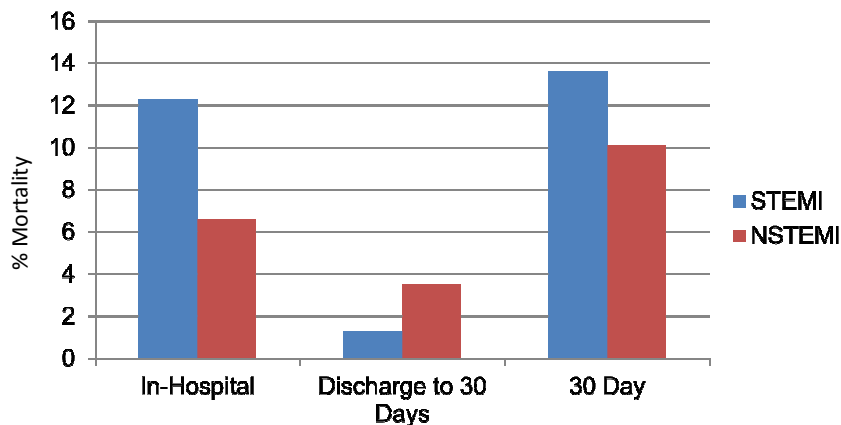

- Recruit a multi-disciplinary “Guiding Coalition” at DHMC
- Learned about what AMI mortality (STEMI vs NSTEMI) looks like here at DHMC

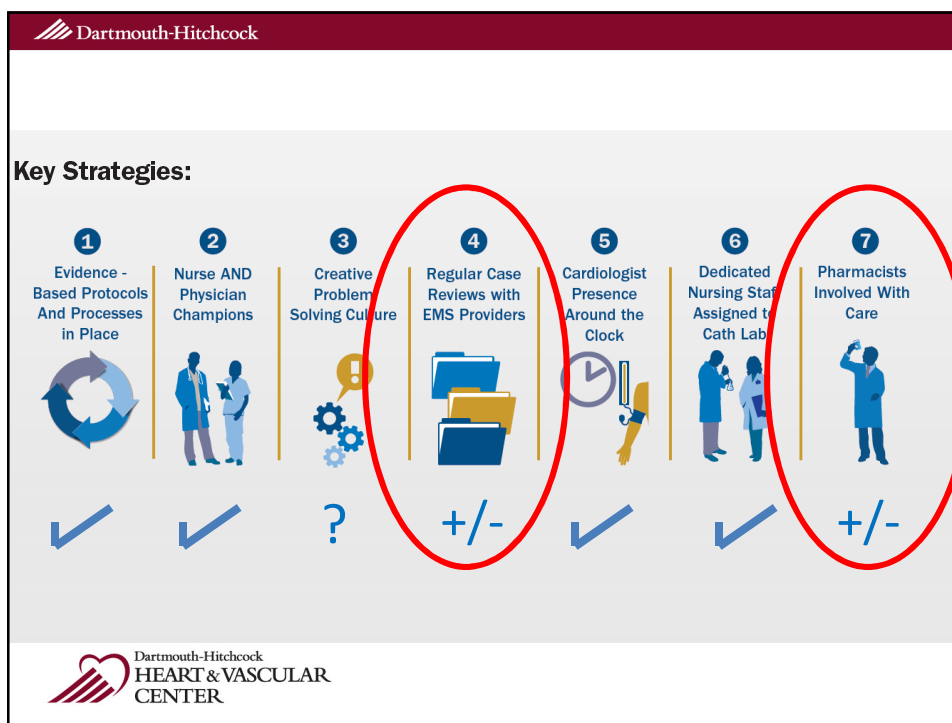

Best Estimates for DHMC STEMI/NSTEMI Mix

Based on DHMC STEMI registry and 2009-2012 CMS data

Age Group ≥ 65 years

N=781

Dartmouth-Hitchcock

Finding More Strategies

Root Cause Analysis = Mortality Chart Review

- Researched and designed Chart Review tool
 - Modeled after Mayo Clinic tool
 - Focuses reviewer on judging Preventable, Possibly Preventable and Not Preventable in hospital mortality
 - 11 domains of contributory issues
 - Tool placed on line (REDCap) for easy access
- Forty-three deaths in the ≥ 65 years age group reviewed (2 years period ending Dec 2014)
 - 43 reviewed by MD and RN
 - 43 reviewed by 2nd MD to de-conflict ratings/opinions

Dartmouth-Hitchcock
HEART & VASCULAR
CENTER

AMI Mortality Chart Review

	“Discharge” Diagnosis	
	STEMI	NSTEMI
Number (%)	17 (40%)	26 (60%)
Age	78.8	79.4
Female Gender	25%	37%
Admitted to Cardiology	94%	85%
Mean TIMI risk score	7.9 (max 14)	5.1 (max 7)
Mean Risk	26% 30 day mortality	26% death, re-MI, recurrent ischemia, urgent revasc.
Initial code status DNR	50%	11%
Cath performed	70%	65%
PCI attempted	55%	22%
Cardiogenic shock	62.5 %	55.5%
Death within 48 hours	62.5%	33.3%

Root Cause Analysis (n=43)

Scenario	Patients #	Ongoing effort to address
Not Preventable	25	
Aggressive care – Death not preventable	18	NA
Patient/Family did not wish aggressive care	7	✓
Definitely Preventable	0	
Possibly Preventable	16	
STEMI with Cath lab Complication	1	✓
STEMI with Iatrogenic infection	1	✓
STEMI with poor communication with referring hospital	2	✓
NSTEMI with Cath lab Complication	1	✓
NSTEMI → Missed STEMI/Delay in revascularization	2	Opportunity?
NSTEMI with delay in initial evaluation, timely re-evaluation	2	Opportunity?
NSTEMI with Suboptimal Hospitalist/Cardiology fellow supervision/communication	2	Opportunity?
NSTEMI with Delay in Catheterization	1	Opportunity?
NSTEMI with Delay in ECHO	2	Opportunity?
NSTEMI with delay in CT surgery evaluation	1	✓
NSTEMI with CABG Complication (failure to wean from pump)	1	✓
Coding Error (not AMI)	2	Opportunity?

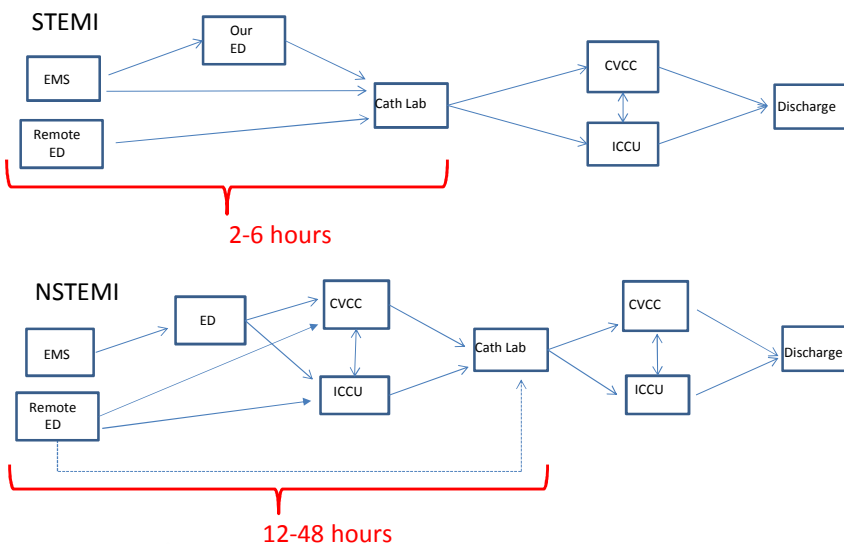

Timing of Development of Critical Illness

	Setting of cardiac arrest, respiratory failure or hypotension/shock				
Admit Dx	Pre hospital	ED	ICCU/CVCC (pre cath)	Cath Lab	Post Cath
STEMI (n=17)	4	4	1	5	3
NSTEMI (n=26)	3	5	12	2	4

Can we shorten or eliminate the time NSTEMI patients spend in ICCU/CVCC waiting for cath?

Can we detect clinical deterioration in ICCU/CVCC at an earlier point in time and intervene before an irreversible deterioration occurs?

Process Maps

Strategies (Focus on NSTEMI)

- Improve pre-transfer triage of NSTEMI patients coming from referral Emergency Departments
- Push NSTEMI process of care toward earlier treatment decision
- Lower the threshold for decision for early invasive evaluation in NSTEMI patients - Recent RIDDLE-NSTEMI randomized trial supports this approach
- Lower the threshold to initiate formal re-evaluation of an admitted patient with an ACS diagnosis **and new, recurrent or worsening symptoms**

Selected Strategy #1 NSTEMI Process of Care Proposal

- All NSTEMI transfers have ECGs screened by cardiology attending at the time of the transfer request
- Define “At Risk” NSTEMI Patients
 - Refractory angina or resting/low threshold angina despite medical management
 - Grace Score >140
 - New or presumed new ST depressions on ECG
 - Significantly increasing temporal troponin pattern (>20%)
 - Signs or symptoms of Heart Failure
 - Hemodynamic instability
 - VT or VF
- All “At Risk” NSTEMI transfers verbally presented to attending as part of initial evaluation
- All “At Risk” NSTEMIs have echo evaluation for LV function assessment as part of the initial evaluation

NSTEMI Process of Care Proposal

Implementation Experience

- Cardiology attending physician push back
 - Change = bad
 - Evidence is anecdotal
 - Perceived negative impact on 'work-life' balance
- Routine early echo 'not feasible'
- With support of section leadership and some compromise → successful implementation
- Focused education on: house staff:
 - hospitalist night coverage
 - associate providers
 - cardiology fellows
 - cardiology triage nurse (accepting transfers)
- Gradual acceptance of "at risk" status as criteria for acceptance for immediate transfer from referring hospitals

Changing Behaviors

Selected Strategy #2

“ACS Patient in Distress Protocol”

- Goal: To identify clinical deterioration of admitted, non-ICU ACS patient and speed up the provider response and evaluation
- Completed best practices process mapping for patient admitted with ACS patient with suspected recurrent or ongoing ischemia
- Redo the “*Chest Pain Protocol*” to encompass more varied and atypical symptoms and signs of ischemia (SOB, nausea, general malaise, dizziness with hypotension, palpitations/tachycardia)
 - all nurses on floor trained to perform ECGs
 - nurse driven protocol

Strategy #2

Implementation Experience

- Pre-work was comprehensive with nursing leadership
- Protocol/proposals were well thought out and well designed
- Senior nursing leadership support was strong
- User group chosen carefully
 - Enthusiastic reception by cardiac nurses
 - Empowerment to initiate protocol
 - New skill training (ECG)

<h2>ACS Patient in Distress Pilot</h2> <ul style="list-style-type: none"> • 12 week period in Intermediate Coronary Care Unit (ICCU) • ~750 Discharges in that period • Protocol initiated in 69 patients (~9.2%) • Results <ul style="list-style-type: none"> • Median time to ECG = 5 min (79% obtained within 10 min of symptom onset) • Median time to Provider at bedside = 9 min. • Troponin triggered in 39 of 69 (57%) • Troponin (converted to positive or increased by 20%) in 14 of 39 (36%) • Emergent cath triggered 7/69 (10.1%) • Acute STEMI 1/69 (1.4%) 	
	

Ongoing Work – Maintain the Gain

- The coalition continues to meet monthly to assure focus on AMI mortality
- Concurrent mortality review with verbal feedback to care team to identify potentially preventable events
- “Dashboard” Creation = using the EMR to track strategy implementation and outcomes

Health Care, Education and Research

Regional work raised awareness of AMI care

Leadership Saves Lives

Yale project aims to improve heart attack care at Billings hospital through organizational culture

By JACHERNDT
Billings Clinic

"We want all people to have their voice heard without having to worry about what level they're on. This is a big deal. A lot of people are invested in this. All these levels are necessary to take care of the patient and the goal at the end is to take the best care of the patient we can."

Interventional cardiologist helping to spearhead the clinic's involvement

Dr. Clint Seger, the clinic's regional chief medical officer, said that "coordination of AMI care is essential to the patient's health and where we live. The end of the road is to further discuss findings and what to do moving forward."

The hospitals — which span the U.S. from New Hampshire to Florida — were selected for the program in part due to their inclusion teaching and non-teaching organizations.

AMI STEMI's and Transfers

Calendar Year	Total AMI's	Total STEMI	Total NSTEMI	Transfers	
2014	329	126	203	174	60% transfers
2015	364	87	277	199	55% transfers
2016	359	109	250	214	60% transfers

Health Care, Education and Research

Mission: Lifeline MT STEMI (ST-Segment Elevation Myocardial Infarction) PHYSICIAN ORDERS- THROMBOLYTIC OPTION

Diagnostic Criteria for STEMI

- ST elevation at the J point in at least 2 contiguous leads of ≥ 2 mm (0.2 mV) in men or ≥ 1.5 mm (0.15 mV) in women in leads V2-V3 and/or of ≥ 1 mm (0.1 mV) in other contiguous chest leads or the limb leads.
- New or presumably new LBBB at presentation occurs infrequently, may interfere with ST-elevation analysis, and should not be considered diagnostic of acute myocardial infarction (MI) in isolation. If doubt persists, immediate referral for invasive angiography may be necessary. Consult with PCI receiving center.
- ECG demonstrates evidence of ST depression suspicious for a Posterior MI consult with PCI receiving center.
- ***If initial ECG is not diagnostic but suspicion is high for STEMI consider serial ECG's at 5-10 minute intervals

ACTIVATE TRANSPORT and Determine transport mode

Health Care, Education and Research

Get Tough on Angina

An Educational Booklet for Patients and Families

Findings and Conclusions

Angina is a common heart condition that causes chest pain and discomfort. It is often caused by a narrowing of the arteries that supply blood to the heart. This booklet provides information on how to manage angina and improve your quality of life.

Stress Less

Stress can trigger angina attacks. Learning to manage stress through relaxation techniques, such as deep breathing and meditation, can help reduce the frequency and severity of your symptoms.

Remember:

- Control your risk factors.
- Take your medicine as directed.
- Tell your doctor about any new symptoms.
- Know when to call for help.
- Stay active and healthy.
- Get regular checkups.
- Take care of your feelings.
- Don't smoke.

To Receive More Information

Fill out this card and mail it to: www.pca.org/education

We Value Your Feedback!

Please complete this booklet and return it to: www.pca.org/education

Billings Clinic

LifeFit

Cardiovascular Rehabilitation

Billings Clinic

EVERETT CENTER

Heart disease is the leading cause of death and stroke in the United States. Angina is a common heart condition that causes chest pain and discomfort. This booklet provides information on how to manage angina and improve your quality of life.

ABOUT THE LIFE-FIT FACILITY

When you enroll in the Billings Clinic LifeFit program, you will receive a booklet that provides information on how to manage angina and improve your quality of life. The booklet is designed to help you understand your condition and make lifestyle changes that can help you feel better and live longer.

WHY IS ANGINA SUCH A COMMON HEART PROBLEM?

- Coronary artery disease
- Diabetes
- High cholesterol
- High blood pressure
- Inactive lifestyle
- Age: People over 55 are more at risk than younger people

COMPLICATIONS

Angina can lead to serious complications if it is not managed properly. These include heart failure, heart attack, and even death. It is important to work closely with your doctor to manage your angina and prevent these complications.

YOU HAVE A COMMON SENSE ABOUT ANGINA

Angina is a common heart condition that causes chest pain and discomfort. It is often caused by a narrowing of the arteries that supply blood to the heart. This booklet provides information on how to manage angina and improve your quality of life.

My Heart and I

A journey to a healthier heart

billingsclinic.com/heart

What is a heart attack? 1

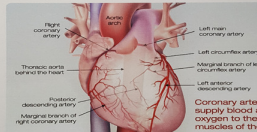

Did you have a heart attack?
☐ Yes ☐ No

What are some other names used for "heart attack"?

- NSTEMI (non-ST EMI)
- STEMI
- MI (myocardial infarction)
- AMI (acute myocardial infarction)

What is a heart attack?

A heart attack occurs when the blood flow to your heart becomes reduced or to a blockage in your vessels in your heart.

About every 43 seconds, someone in the US has a heart attack.

The first two weeks... 4

What do I need to know?

Site care

Your catheterization should be performed through a radial/wrist puncture site or a femoral/groin puncture site.

- You may shower the day after the procedure, however no soaking the site
- Do not flex or bend the wrist for 24 hours
- No heavy lifting, pushing, or pulling greater than 10 pounds for 1 week
- You may not drive or operate heavy machinery for 24 hours following the procedure
- You may notice bruising at the site, but it should be painless
- Seek medical attention if you experience any of the following:
 - Redness, warmth, swelling, or pain at the puncture site
 - Drainage
 - Fever or chills persistent for greater than 72 hours
 - Your limb becomes painful, cool to touch, or pale
 - If you start bleeding at the site, apply pressure

Activity restrictions

• No strenuous exercise for 2 weeks following a heart attack

Quality Improvement
for Institutions

Quality Improvement
for Institutions

The Quality Improvement for Institutions program combines
the ACC's NCDR data registries with toolkits and proven
hospital-based quality improvement initiatives like
Hospital to Home, the D2B Alliance and Surviving MI.

Simple Solutions. Big Impact. CVQuality.ACC.org.

Quality Improvement
